

# Hangman Case – Step Summary

---

## **Step 1 – Understand the Problem:**

Break Hangman into smaller problems: secret word, user input, guesses, lives, and win/lose conditions.

## **Step 2 – Add Secret:**

Create and store the secret word that the player must guess.

## **Step 3 – Basic Input Loop:**

Repeatedly ask the player for a single-character guess and reject invalid-length input.

## **Step 4 – Lowercase Input:**

Convert every guess to lowercase so uppercase and lowercase letters are treated the same.

## **Step 5 – Guesses Structure:**

Store guessed letters and use them to display the currently revealed parts of the secret word.

## **Step 6 – Add Guard:**

Reject characters that are not valid letters from a to z.

## **Step 7 – Print Guesses:**

Display the letters the player has already guessed together with the current word status.

## **Step 8 – Complete the Game:**

Add lives, detect correct and incorrect guesses, check win/lose conditions, and stop the game when finished.
